1. Benchmark Description

The benchmark is done on a Pentium 4 3Gh, 512 Mo with the sun jdk1.4.2_03 in server mode (-server). The stack size used is the default jvm size (no -X options).

Note:

By default, the mindom heuristic for choosing variable and the increasing domain heuristic for choosing value are used. Ties between variables are broken with the order where variables were created (The first minimum domain variable created is selected).

1.1. N Queens

The problem is modeled with N integer variables of domain 1 .. N corresponding to each line of the board, and only inequality constraints are used.

1.2. Magic Square

The problem is modeled with N * N integer variables of domain 1 .. N * N corresponding to each cell of the square, and linear combinations are posted for each line, each column and the two diagonals (the magic number is given a priori).

1.3. Golomb Rules

N variable for all distances (all pairs of mark) are used. Differences between all distances are stated with a BoundAllDiff constraint. Moreover, a global redundant constraint is added. The variable selection is done in the order of distances (from 0 to 1,2,3, then from 1 to 2,3,4, etc ...) : the first non instantiated distance is chosen.

1.4. Latin Square

The problem is modeled with N * N integer variables of domain 1 .. N corresponding to each cell of the square, and uses simple inequalities between variables of the same line and column.

2. Last Version Performance (in ms)

Problems	MAC	CBJ	MACDBT	DR
MagicSquare 4 all	45641	241781	N/A	N/A
MagicSquare 5 one	688	1656	16578	6281
NQueens 12 all	11532	52235	427922	N/A
NQueens 13 all	59688	298015	N/A	N/A

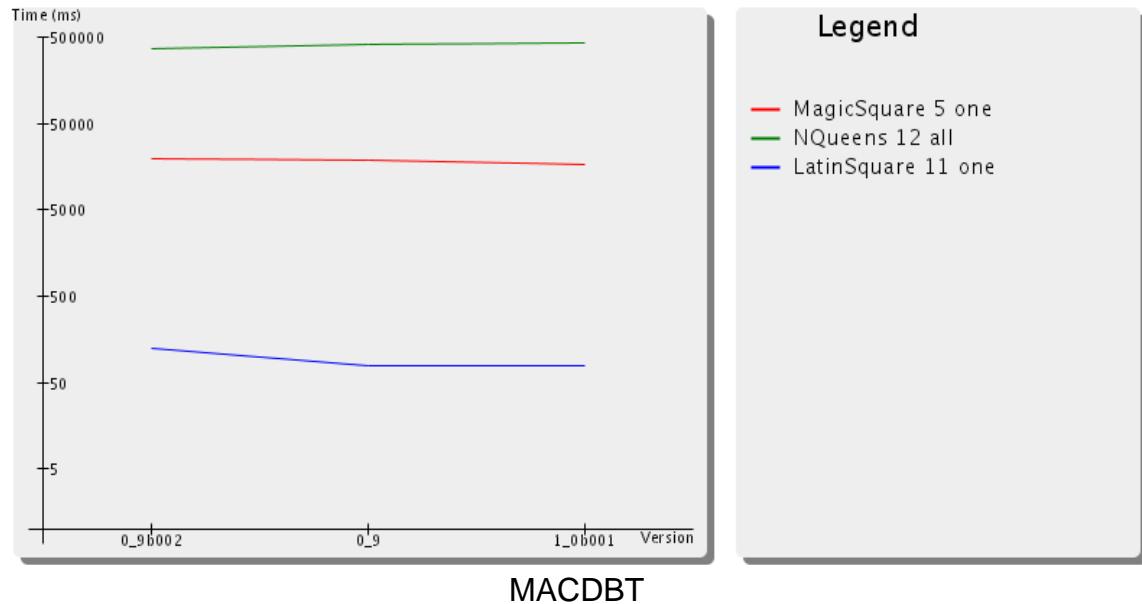

Choco Performance Report

NQueens 14 all	352704	N/A	N/A	N/A
GolombProblem 11 one	101078	N/A	N/A	N/A
GolombProblem 12 one	970484	N/A	N/A	N/A
LatinSquare 11 one	N/A	47	78	78
